Procession the Product

Procession's Task Orientated Application "TOA" is a unified and complete framework that develops applications by the separation of business logic from delivery mechanisms. The core design philosophy recognises any interaction, human or machine, with systems is via different types of work/tasks and at this fundamental level there are less than 13 such types of tasks. It is at the work level where all source information is created in any business. The end result is that the build of solutions is created direct from a graphical model and puts control of the build into the hands of business analysts and driven by business knowledge.

A TOA is generic in capability and independent of function. It takes a step beyond the traditional simple activity sequence to reflect the reality of the dynamic, adaptive network of interconnected things that people have to deal with in their daily work.

The unified framework includes

- Process engine
- Rules engine
- Calculation engine
- State engine
- Workflow
- Audit trail
- Time recording
- Real time reporting
- Presentation layer with TAG library
- Roles and performers
- Management hierarchy
- User interface dynamically created linking people, roles, task type and data via forms using web or client server
- Automatic population of custom documents, letters, e-mails, messages etc with required information on pre built templates.
- Simplified table creation in Oracle Database
- Process change with full version control
- Server Side Message Queue
- XML runtime and design Gateways

Access to develop an application is via a graphical designer that allows a custom build incorporating all the above attributes. The code never changes and no code is compiled to deliver a deployable solution.

The key benefits to the business

- Rapid (c 70% of cost/time savings from project identified to delivery) and iterative build to encourage input by users and evolutionary roll out.
- A solution that delivers exactly as required reflecting how business really works.
- Built-in agility in the software to allow change as the business requirements change.
- Compliance in the process can be guaranteed as required with full audit trail.
- Real-time operational information to support Performance Management, Activity Based Costing and Profitability Analysis.

Quote from senior executive responsible for re-write of 10-year-old technology

"In redeveloping the application set, I am looking for a tightly integrated system as opposed to a well integrated set of application modules."

This what the next generation solutions require and Procession delivers now.
